

Discussion: Liquidity Regulation, the Central Bank and the Money Market

Beatrice Scheubel and Julia Koerding Discussant: Jean-Edouard Colliard, ECB

October 21st, 2014

Rich framework in which a number of issues can be studied:

- Role of the central bank in case of market freezes.
- ▶ Use of the CB's interest rates or collateral framework.
- Impact of liquidity regulation (LCR) on the money market and demand for CB funding.
- Impact of the CB's policy and liquidity regulation on risk-taking.
- Outcome of the non-cooperative behavior of the CB and the bank regulator.

Ingredients:

- Interbank market with frictions, moral hazard and adverse selection.
- Central bank with a corridor system and a collateral framework.
- ► Asset/Liability mismatch and rationale for liquidity regulation.
- Liquidity coverage ratio as a regulatory constraint.
- Objectives of the CB and the regulator, non-cooperative interaction.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Difficult modeling choices. What to include or leave aside? Can be streamlined / Needs more microfoundation

- Interbank market with frictions, moral hazard and adverse selection.
- Central bank with a corridor system and a collateral framework.
- Asset/Liability mismatch and rationale for liquidity regulation.
- Liquidity coverage ratio as a regulatory constraint.
- ► Objectives of the CB and the regulator, non-cooperative interaction.

Too ambitious?

Interbank market may be too complex. Simpler version:

- Borrowers need 1 to invest. Can borrow $\lambda < 1$ at R^{S} .
- Success probability p, private information.
- Payoff safe asset: $A \lambda R^S (1 \lambda)R^U$.
- Payoff risky asset: $p(\theta \lambda R^S (1 \lambda)R^U)$.
- Invest in the safe asset if and only if $p \leq p^T$:

$$p^{T} = \frac{A - \lambda R^{S} - (1 - \lambda) R^{U}}{\theta - \lambda R^{S} - (1 - \lambda) R^{U}} < \frac{A}{\theta} = p^{*}$$

Lenders must be indifferent:

$$R^{S} = \mathbb{E}\left(p|p > p^{T}\right)R^{U}$$

 Already quite complex (Stiglitz and Weiss, 1981); see also Allen, Carletti and Gale (2009), Heider, Hoerova and Holthausen (2009).

The Central Bank

- Three unknown, two equations. CB sets R^S.
- How? Unclear that $R^S = R^{df}$.
- Possibility to borrow μ on top at R^{CB} .
- ▶ CB indirectly controls p^T and R^U : $\searrow R^{df} \Rightarrow \searrow R^S$, $\nearrow p^T$, $\searrow R^U$.
- Intervention in a market with asymmetric information cf. Philippon and Skreta (2012) and Tirole (2012).
- ► Trade-off: R^U close to target vs. credit risk. Note: less risk when lowering interest rates (not general).
- ▶ Begs one question: why is \u03c0 + \u03c0 \u2267 \u03c0 \u0

Liquidity regulation

- ► LCR difficult to rationalize, in particular with only one maturity ≠ Bech and Keister (2013).
- Here incentives to use secured funding already maximal, no impact of LCR.
- Simpler alternative: LCR introduces a wedge Δ between R^{CB} and both R^S and R^U.
- CB moves second, can compensate higher Δ with higher R^{CB} (changes the ZLB).
- ▶ Nash outcome? Depends on the objectives of the regulator.
- Natural objective: reduce the gap between p^T and p^{*}. But is that liquidity regulation?
- Compare Nash and cooperative outcome, depending on objectives. See Kahn and Santos (2005).
- Deeper question on the architecture of financial regulation.

- Promising draft, many interesting elements.
- Framework needs streamlining in order to answer precise questions e.g. why is adverse selection needed?
- The existing literature could be used more, if only to avoid discussing too many problems.
- Most interesting contribution would be the competition between the CB and the regulator. Microfoundation challenging.
